

Interactive Map: Hundreds of Known Russian Military Objects are in Range of ATACMS

August 27, 2024

By George Barros

Hundreds of known Russian military and paramilitary objects in Russia are in range of Ukrainian ATACMS. ISW presents the following list and interactive map of known military and paramilitary objects to illustrate the extent to which US restrictions on Ukraine’s use of ATACMS constrains Ukraine’s ability to strike important military infrastructure in Russia.

Anonymous senior US officials have suggested that the redeployment of Russian combat aircraft from airfields in Russia within ATACMS range and the low number of ATACMS that the US has provided to Ukraine somehow reduce the validity or importance of the Ukrainian request.¹ *Politico* reported on August 23 that an unnamed senior Biden administration national security official stated that Russian forces have moved some objects out of range of Western-provided Storm Shadow and ATACMS missiles.² An unnamed administration official also reportedly stated that Russian forces have moved 90 percent of the aircraft that conduct glide bomb strikes from Russian airspace away from airfields within range of Storm Shadow and ATACMS missiles.³ Sixteen Russian air bases are located in range of Ukrainian ATACMS in Russia, and ISW has observed confirmation of redeployments of Russian aircraft to air bases out of range of Western-provided long-range weapons.⁴

The redeployment of Russian aircraft from 16 Russian air bases in range of ATACMS does not reduce the importance of allowing Ukraine to use ATACMS against hundreds of other Russian military objects, however, nor does the reportedly small number of ATACMS the US has provided. US policy continues to restrict Ukraine from using ATACMS to strike no fewer than 245 known Russian military and paramilitary objects – of which only 16 (6.5%) are air bases –as of August 26, 2024.⁵ (ISW previously assessed that 250 objects – including 17 air bases – were in range of Ukrainian ATACMS based on a control of terrain assessment conducted in May 2024.) The maximum range of Ukrainian HIMARS – which the US allows Ukraine to use in Russia under limited circumstances – encompasses 20 of these objects.⁶ At least 225 known objects are in range of ATACMS but not within the range of HIMARS. **At least 209 of 245 (over 85%) known Russian military objects in range of ATACMS are not air bases.** Ukrainian forces are using indigenous long-range strike systems to hit some of these targets, but they do not appear to have many such systems—so the relatively small number of ATACMS Ukraine has reportedly received could make significant difference.

The argument that the limited redeployment of Russian aircraft from 16 airfields makes the discussion of lifting US restrictions on the use of ATACMS somehow moot ignores the hundreds of these facilities laid out within this report. Ukrainian officials are reportedly preparing to present senior US officials a list of objects in Russia that Ukrainian officials

believe Kyiv could strike if Washington lifted its restrictions on US weapons.⁷ ISW has not seen the Ukrainian list and offers no assessment of the possible overlap between the list published in this report and the list Ukrainian officials have prepared.

It is unlikely that the Russian military has redeployed assets away from all 245 objects to the same degree as it has done with aircraft.⁸ ISW has not observed evidence of redeployments of military assets from the majority of Russia’s rear areas. The mass redeployment of assets away from such facilities would present significant challenges to Russian logistics throughout the theater, and neither open sources nor US officials have indicated that Russian forces have engaged in such logistical upheavals. The *Associated Press* quoted a Ukrainian artillery commander in June 2024 who stated that Ukrainian forces could strike Russian brigade command points at scale if the US approved Ukraine’s

use of ATACMS to strike Russian territory but currently cannot because Russia has deployed such command and control elements in an area 100 to 150 kilometers away from the front line – territory outside the range of HIMARS but still in range of ATACMS.⁹

Note: This list of 245 known objects does not include the various field camps and new installations that the Russian military has erected near Ukraine to support Russia's war. This list is therefore conservative and only identifies a portion of all the military objects in range of ATACMS. The regimental, brigade, and division headquarters provided in this list are mainly relevant in how these objects facilitate training and serve as storage areas, since the combat units that are normally permanently based here are forward deployed in Ukraine. ISW would like to acknowledge X (formerly Twitter) users @Archer83Able and @breakingcraft_ for collating this comprehensive data set on Russian military and paramilitary objects.¹⁰ ISW has verified their findings and conducted additional geospatial analysis to determine which objects are within the maximum range of ATACMS, based on ISW's control of terrain assessment as of August 26, 2024.

Any assessment that rejects allowing Ukraine to strike legitimate military objects in Russia on the exclusive basis of air asset redeployments is incomplete because it fails to account for the hundreds of other objects supporting Russia's war against Ukraine and would thus be incorrect. ISW is not asserting that the redeployment of Russian air assets is the only reason for the continuation of the US ban on the use of ATACMS against legitimate military targets in Russia as ISW is not privy to US decision-making. This report is intended to respond to what appears to be an attempt to dismiss the value and importance of reevaluating these restrictions based on a partial presentation of the situation.
